

passenger - seat		3C	6B	1B	3B	1A						
row_number					outside of plane	inside plane	1	2	3	4	5	6
line_index		4	3	2	1	0						
1st seating time	t = 1	3	6	1	3	1	↑					
	t = 2			3	6	1			3	↑		
				3	6	1	↑					
	t = 3								3			6
								3	↑			

Above is the test in a schema.

For now I considered that the boarding line has passengers waiting inside and outside of the plane. They will be able to seat depending on their row number solely (ignoring their column numbers for now). I am not taking into consideration the time it takes for passengers to walk.
